New isolated mycobacteria polypeptides and nucleic acids - used developing products for the diagnosis of or vaccination against mycobacterial infections, particularly tuberculosis. for

Claim 1; Page 222; 163pp; English.

The present sequence represents a Mycobacterium tuberculosis protein. Products from the present invention, which describes protein fragments and nucleic acid fragments derived from M.tuberculosis, can be used in the detection of and prevention of mycobacterial infections. In particular, the proteins and nucleic acids can be used for the diagnosis of or vaccination against tuberculosis caused by M. tuberculosis, M. africanum or M. bovis

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            RESULT
The invention describes a substantially pure immunogenic polypeptide fragment (I) from Mycobacterium tuberculosis that is able to evoke a protective immune response against infections by mycobacteria belonging to the tuberculosis complex. The invention provides a (I) fusion polypeptide comprising at least one polypeptide fragment (I) and at least one fusion partner; (2) a fusion polypeptide fragment comprising a T-cell epitope from M. tuberculosis protein ESAT-6, or MPT59 and a second different amino acid sequence from M. tuberculosis, and/or including a sequence which protects the first amino acid sequence from in vivo degradation or post-translational processing; (3) a nucleic acid fragment that encodes the above polypeptides. The polypeptides and nucleic acid are useful as pharmaceuticals, for diagnosis of and as antigens for vaccination against TB caused by Mycobacterium tuberculosis, africanum or bovis. The polypeptides are also useful for diagnosing ongoing or previous sensitization in an animal with bacteria belonging to the tuberculosis complex. The invention also describes the use of CFP7A or CFP3OA or a T-cell epitope of for the induction of a strong immune

The fine CC compound, a vitamin, a cofactor, a polyketide, or an enzyme. The fine CC compound, a vitamin, a cofactor, a polyketide, or an enzyme. The fine CC commical production can be modulated. The presence of (I) or the SRT CC proteins (III) encoded by them are used for diagnosing the presence or CC activity of Corynebacterium diphtheriae. (I), (II), and host cells CC containing them can be used to map the genomes of organisms related to C. glutamicum, to identify and cloalise C. glutamicum sequences of interest, CC in evolutionary studies, in determination of SRT protein medical required CC for function, in modulating the SRT protein activity, and in modulating CC the activity of an SRT pathway. (II) are used to permit C. glutamicum to courrive in an environment that is normally environmentally or chemically call to it. (I) and protein molecules encoded by it increase the CC survival of C. glutamicum to chemical and environmentally escale call to provide a means for continued growth and multiplication in large scale CC environmentative growth conditions. By increasing the growth rate or maintaining a normal growth rate in poor or toxic conditions, the yield, conduction and/or efficiency or production of fine chemicals from a conduction and/or efficiency or production of fine chemicals from a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                           sequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from Coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacteria are useful for producing amino particularly L-lysine. The present sequence and organic acids, operation of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the European Patent Office

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence is the protein sequence of a Corynebacterium CC glittamicum cold shock protein (sp). The invention provides a plant that CC shows improved abiotic stress tolerance as a result of the expression of a Csp in its cells. In one embodiment, a polynucleotide encoding a Csp is CC operably linked to a plant promoter and plant terminator. The polynucleotide preferably encodes a protein comprising a specified Csp conserved motif ADZ21430, particularly Bacillus subtilis CspB ADZ21429 or its homologues, Escherichia coll CspA ADZ21428 out its homologues, a Csp is conserved motif ADZ21430, particularly Bacillus subtilis CspB ADZ21429 or its homologues, Escherichia coll CspA ADZ21429 or its homologues, a Csp is conserved motif ADZ21430, particularly Bacillus subtilis CspB ADZ21429 or its homologues, Escherichia coll CspA ADZ21429 or its homologues, a Csp is constitutive, temporally-regulated, developmentally-regulated, tissue-specific constitutive, temporally-regulated, developmentally-regulated, tissue-specific preferred, cold enhanced, cold-specific, stress enhanced, stress-correct with a DNA molecule that expresses a Csp is claimed. The CC plant may be a crop plant, a monocot or dicot, and is especially selected from soybean, corn, canola, rice, cotton, barley, oat, turf grass, cotton cand wheat. The transgenic plant that has been transformed what tolerance, cold colerance, salt tolerance, drought tolerance and survival after cold shock than the corresponding non-transformed plant.

Corynebacterium

glutamicum.

```
CC compound, a vitamin, a cofactor, a polyketide, or an enzyme. The fine compound, a vitamin, a cofactor, a polyketide, or an enzyme. The fine chemical production can be modulated. The presence of (I) or the SRT croteins (II) encoded by them are used for diagnosing the presence or activity of Corynebacterium diphtheriae. (I), (II), (III) and host cells containing them can be used to map the genomes of organisms related to C. Compound them can be used to map the genomes of organisms related to C. Compound them can be used to map the genomes of organisms related to C. Compound the compound the compound of containing an in modulating the sRT protein activity, and in modulating the sRT protein activity, and in modulating the sRT protein activity, and in modulating the sRT protein activity, and in modulating compound that is normally environmentally or chemically because to it. (I) and protein molecules encoded by it increase the CC survival of C. glutamicum to chemical and environmental hazards and compound the conditions. By increasing the growth rate or conditions, the yield, production and/or efficiency or production of fine chemicals from a

                                                                                                                                                                                               sequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from Coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacteria are useful for producing amino acids, nucleic acids, vitamins, saccharides and organic acids, particularly L-lygine. The present sequence is a protein described in the exemplification of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the European Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                    Novel polynucleotides derived from Coryneform bacteria, for identifying mutation point of a gene, measuring expression of a gene, analyzing expression profile or pattern of a gene and identifying homologous gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Nakagawa

```
the 613 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are: (1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation, or that has an activity against a biological pathway required for proliferation, or that inhibits cellular proliferation of the biological pathway in which a proliferation-required gene or a gene on which the test compound that inhibits proliferation of a gene or which the test compound that inhibits proliferation of a gene on which the test compound that inhibits proliferation of a compound's activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent to which each of the strains is present in a culture or collection of strains, or (13) identifying the target of a compound that inhibits the confound that inhibits the gene condition of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   21-MAR-2001; 2001US-00815242.

                                                                                                                                                                                                                                                                                                                            polypeptides. The invention also relates to a recombinant expression vector comprising a polymucleotide operably linked to a transcription regulatory element, a cell comprising a recombinant vector, a method for producing an E. faecalis polypeptide, an isolated nucleic acid comprising a sequence not given in the specification, a recombinant vector comprising the nucleic acid and a cell comprising the recombinant vector. The polymucleotides can be used to detect the presence of E. faecalis in a sample. The sequences are useful for preparing a composition for diagnosing or treating Enterococcus faecalis infection. This sequence represents an E. faecalis polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New nucleic acid comprising a sequence encoding an Enterococcus fecalis polypeptide, useful for preparing a composition for diagnosing or treating E. fecalis infection.

                                                                                           ঠ
                                                                                                                                                                                             CC nucleotide sequence encoding the heterologous polypeptide and a promoter cc and 5' untranslated region (UTR) from a cold shock inducible gene, such cc as cspG, which directs its expression. An AT-rich sequence that enhances cranslation under cold shock inducible conditions is present either in cc the coding sequence of the heterologous polypeptide or in an additional cc element inserted between the coding sequence and the cold shock inducible cc promoter and 5'-UTR. The DNA molecule preferably also includes the cspA cc yrong sequence. Inducing expression by cold shock eliminates the need cc for chemical induction, and under cold conditions all ribosomes in the close are forced to express the single target protein, which simplifies cc purification. When used to prepare isotopically labelled proteins; the cculture size, and thus amount of expensive labelled reagent, can be creduced. The method can also be used to produce proteins native to cold-crimate organisms at high yield

                                                                                                                                                                                                             constitutive, temporally-regulated, developmentally-regulated, tissue-preferred, cold enhanced, cold-specific, stress enhanced, stress-specific, drought inducible, water deficit inducible or tissue-specific promoter. An abiotic stress-tolerant transgenic plant that has been transformed with a DNA molecule that expresses a Csp is claimed. The plant may be a crop plant, a monocot or dicot, and is especially selected from soybean, corn, canola, rice, cotton, barley, oat, turf grass, cotton and wheat. The transgenic plant shows improved heat tolerance, cold tolerance, salt tolerance, drought tolerance and survival after cold shock than the corresponding non-transformed plant.
                                                                                                                                                                                                                                                                                                                                                                                The present sequence is the protein sequence of a cold shock protein (Csp) from Escherichia coli. The invention provides a plant that shows improved abiotic stress tolerance as a result of the expression of a Cs in its cells. In one embodiment, a polynucleotide encoding a Csp is operably linked to a plant promoter and plant terminator. The polynucleotide preferably encodes a protein comprising a specified Csp conserved motif ADZ21430, particularly Bacillus subtilis CspB ADZ21429 its homologues, Escherichia coli CspA ADZ21428 or its homologues, a csp from Agrobacterium tumefaciens or other Csp protein of the invention, such as the present Csp. The promoter is selected from an inducible, constitutive, temporally-regulated, developmentally-regulated, tissue-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New recombinant DNA molecule comprising a DNA polynucleotide promoter and a DNA that encodes a cold shock protein, useful producing plants with increased tolerance to abiotic stress.
                                                                                                                                                                                     Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Claim 4; SEQ ID NO 19; 169pp; English.

                                                                                                                                                                                                                                                                           The invention describes a new isolated nucleic acid encoding a Klebsiel pneumoniae polypeptide. Also described are: a recombinant expression vector comprising the nucleic acid, operably linked to a transcription regulatory element; and a cell comprising the recombinant expression vector. The nucleic acid is useful for preparing a vaccine composition against Klebsiella pneumoniae. This is the amino acid sequence of a Klebsiella pneumoniae polypeptide of the invention

The nucleic acid is useful for regulating expression of cold shock inducible genes to elicit the cold shock response in bacterium under conditions of physiological stress. The present sequence is Bacherichia coli cspG protein used in the exemplification of the invention.

                                                                                                                                                                                                                                                                                                                                         The invention relates to a family of stimuli-induced in particular stress cc or cold-shock induced genes and proteins. An isolated DNA molecule (I) is provided that comprises a prokaryotic promoter that is induced under conditions eliciting a cold shock response (Csp), or the promoter that is comprise a cc conditions eliciting (Sp, where the conditions comprise a cc decrease in temperature below the normal physiological growth temperature cc of the prokaryotic cell, preferably bacterium. (I) is useful for encoding proteins under stimuli-induced, particularly stress or cold-shock induced conditions. The encoded proteins are useful in staining DNA and in the creatilization of DNA and RNA, and thus increasing the efficiency of DNA cand RNA in various in vitro reactions. The encoded protein is also useful as desaturase to denature DNA irrespective of temperature. The proteins care also useful for commercial purposes. The present sequence represents a s. clavuligerus CspA-like protein SC7.0

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             DB DB

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  8
        Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    멂田

Publication No. US20060019284A1

GENERAL INFORMATION:

APPLICANT: Bristol-Myers Squibb Company

TITLE OF INVENTION: IDENTIFICATION OF POLYNUCLEOTIDES FOR PREDICTING ACTIVITY OF

TITLE OF INVENTION: COMPOUNDS THAT INTERACT WITH AND/OR MODULATE PROTEIN TYROSINE

TITLE OF INVENTION: KINASES AND/OR PROTEIN TYROSINE KINASE PATHWAYS IN LUNG CANCER

TITLE OF INVENTION: CELLS

FILE REFERENCE: 10001 NP

CURRENT APPLICATION NUMBER: US/11/169,041
